

JANUARY 2024 NACR QUARTERLY REPORT ON PSYCHOSOCIAL WELLBEING OUTCOMES (re-run using April 2024 extract)

(Jul to Sept 2023 data; patient records were included if they had an assessment 2 recorded within the time period and there was sufficient data – 10 or more assessment records with measures for HADS Anxiety/Depression or PHQ-9/GAD-7 completed both pre and post rehabilitation)

Introduction: In this Quarterly report and the next two reports, the focus will be on outcomes. This is to highlight that despite uptake being of focus, the whole pathway should be evaluated to maximise patient benefit.

The report details, at programme level, the outcomes for patients upon completion of Cardiac Rehabilitation (CR) for psychosocial wellbeing outcomes. Psychosocial wellbeing is a key aspect of the BACPR Standards and Core Component for CR and measuring this for patients is essential for effective evaluation. These outcomes are for Anxiety and Depression, measured by the HADS or the PHQ-9/GAD-7 questionnaires.

Method: For the purpose of reporting, patient's questionnaire scores were recoded into 'normal' or 'not normal'. The normal status was a score for HADS of less than 8 and the not normal was greater than or equal to 8 and PHQ-9/GAD-7 was <6 or ≥6 (normal or not normal respectively). Based on the number of patients within the service with measures recorded, percentages were calculated for pre rehabilitation (Assessment 1) and post rehabilitation (Assessment 2). The change is measured as percentage point change based on post % minus pre %.

The measure shown for each programme is the tool, out of HADS and PHQ-9/GAD-7, that was used in the greatest number. Data on both tools for larger time periods are available upon request to the NACR team.

In this period, the number of programmes included in this report was 176. Of these 153 programmes used HADS for the greater number and 15 programmes used PHQ-9/GAD-7. Of all the programmes, 17 programmes had assessment records in the time period, but did not have the minimum required records with HADS or PHQ-9/GAD-7 recorded for inclusion and are labelled as insufficient data.

When looking at the anxiety measures at baseline (i.e. prior to starting CR), on average, there was 72% of patients within normal level of anxiety category (77% for GAD7 and 72% for HADs). Upon completion, the number increased to 77%, which showcases a 5%-point increase (86% for GAD7 and 76% for HADs). At a programme level, there was a large level of variation, with some programmes yielding large improvement in the normal anxiety state (max=33%).

The depression measure on average had 77% of patients as normal at baseline (67% for PHQ9 and 79% for HADs). After CR, the percent of patients on average with a normal score was 84% (81% for PHQ9 and 85% for HADs). In total, there was a 7%-point increase in patients as normal post CR. Similar to the anxiety measure, the programme variation was large, with a maximum of 45% point change for one programme.

* Programme uses both HADS and PHQ-9/GAD-7. Data shown is measure most frequently used.
