

OCTOBER 2025 NACR QUARTERLY REPORT ON COMPLETION OF CORE CARDIAC REHABILITATION BASED ON MODE OF DELIVERY

(run using October 2025 extract)

(Apr-Jun 2025 data; patient records were included if they were recorded as starting/accessing core cardiac rehabilitation (CR) within the time period and there was sufficient data – 10 or more patients starting and with mode of delivery recorded.)

Introduction: Cardiac Rehabilitation (CR) is an evidence-based intervention, proven to improve quality of life and reduce hospital readmissions, The greatest extent of this benefit comes from patients completing the programme and, for many years, NACR has reported CR completion to be at 75% or greater. However, recently data has shown a reduction in the average level of completion. This report highlights the percentage of completion, by mode of delivery for patients starting core CR in April-June 2025. The analysis includes 153 out of 174 services that returned data in the period. Twenty-one of the 174 services did not have sufficient data for reporting: 11 had <10 records starting in the period, seven had no mode of delivery recorded and three had insufficient starters with mode recorded in the period.

The report shows the proportion of programmes recording mode of delivery with either Group-based, Home-based or Hybrid. There was very little difference in the proportion of programmes offering Home-based (129 programmes) and Group-based (123 programmes) and the use of Hybrid (108 programmes) is on the increase. Looking at the average patient throughput by mode of delivery, Group-based is the most frequently taken up by patients with an average 55% of patients, whereas Home-based and Hybrid each represent 36%. This suggests that although there is greater variety in the CR mode of delivery available, Group-based remains the dominant mode of delivery, and furthermore, in 44 of the 123 of services using Group-based mode, the majority of their patients are on this mode (>80%).

Looking at the total completion rate per mode, Hybrid and Group-based had higher than Home-based, 78% and 77% respectively. The Home-based completion rate was 70%, which is considerably less than UK average from recent years.

The findings from this Quarterly Report highlight the complexity around Home-based CR where some services are performing above average for Group-based and or Hybrid but some are falling to 50% completion or lower in Home-based CR. Due to the remote nature of Home-based CR, it is vital to set clear end points, possibly with an in-person discharge assessment (Assessment 2 (post-CR)) scheduled from the outset to set expectations around what constitutes the end of CR. As per BACPR standards this is not only for the completion of Assessment 2 for NACR but to showcase to patients their success, where to focus on next e.g. weight/diet and to provide a discharge summary to primary care or long-term support services such as Phase IV CR.

Note: ongoing work on rolling out a new country-wide database in Northern Ireland is currently impacting data entry levels. We are therefore unable to include Northern Ireland programmes in this quarterly report at the moment.
